FOUNDERS

Erik Hancock (ehanc69)

EDUCATION

Empire College School of Business JD Law
'99-'02

Auburn University BA History And German
'89-'94

WORK EXPERIENCE

Self-Employed — Bar Applicant
SER National — Computer Mar '16–Oct '23
Support Technician Level II Dec '13–May '14

Provide user support for all aspects of Information Technology, to include computer software, hardware and telecommunications. Disassemble and re-assemble complex electronic components. Utilize database for tracking, trouble ticket initiation and install record keeping software. Install company computer hardware at multiple remote locations. Maintain and monitor organization computer server. Purchase all organization replacement computer components. Responsible for \$10.3 million in organization property. Show less

INDUS Corp. — Computer Support
Technician Level I Jan '11–Dec '13

- *Provide end-user Client Support Admin (CSA) and Network Computer Center (NCC) Phone Support for organization employees.*
- *Utilize Active Directory to list organization employees on computer network.*
- *Create Remedy trouble ticket for troubleshooting of computer issues.*
- *Troubleshoot user Smart Card certificate issues.*
- *Troubleshoot organization employee hardware issues including printers, Workstations, and Laptops.*
- *Troubleshoot user computer connectivity and software issues.*
- *Maintain active Secret Clearance.*
- *Remotely diagnose and organizations employee's computer issues with Remote Desktop and Bomgar software. Show less*

US Army — Infantryman Jan '05–Dec '10

• *Train unit personnel in tactics, airborne assault, weapons, explosives, night vision devices, radios, and winter survival equipment.* • *Supervise operations of a 30 member team as shift commander.* • *Prioritize workload and assignment duties, often with a very short notice.* • *Motivate team members to perform in stressful conditions and meet deadlines.*

Army National Guard — Army Special Forces

Dec '86–Nov '20

• *Apply “people skills” to motivate organization employees, build partnerships, and communicate with organization customers* • *Lead organizational change* • *Lead organizations people* • *Provide results driven success* • *Display effective organizational acumen* • *Build coalitions to achieve organization goals.* • *Maintain proficiency in foreign language*

Please tell us in one or two sentences about the most impressive thing other than this startup that you have built or achieved.

Recently, I successfully executed the move of my family from Waco, Texas to Lakeport, California. To successfully accomplish, based on the timeline and resources available? I extensively utilized all my learned leadership techniques. Leadership techniques learned in Army Special Forces School, Army Ranger School, and Army Officer Candidate School. I planned, prepared for, funded, and flawlessly executed the move. A move accomplished with a one-month-old infant son and less than 24 hours of notice to leave before departure. Two months later, I returned to Texas. When there, I successfully hired and supervised the movers to move our three bedrooms of household belongings down three flights of stairs, in July Texas heat. I then returned to California with our household belongings

in a rented moving van. I unloaded and returned the van. All aspects of the move went flawlessly and under budget. Uninitiated, my stepfather praised my accomplishing the move. He is an engineer, retired from management at Barnes & Noble dot com. Thus, I accept and reflect his praise re for you here.

If accepted to YC, will you commit to working exclusively on this project for the next year?*

(Required)

(No school, no other jobs)

Yes

Who writes code, or does other technical work on your product? Was any of it done by a non-founder? Please explain.

I do.

I have no cofounders nor coparticipants.

Are you looking for a cofounder?

Yes.

Please record a one minute video introducing the founder(s).

This video is an important part of the application. Read the [Guidelines](#).

0:00 / 1:01

Company name:

TBD?

Describe what your company does in 50 characters or less.

Designs, develops, manufacturers biotech products

Company url, if any:

If you have a demo, attach it below.

Anything that shows us how the product works. Please limit to 3 minutes / 100 MB.

0:00 / 2:58

Please provide a link to the product, if relevant.
Followed by login credentials, if required.

What is your company going to make? Please describe your product and what it does or will do.

"Bug Zappers for Viruses"

Means for purifying air to safely sustain human life in environment(s) contaminated by viral pathogens, alien organisms, noxious odors, chemical, biological, and nerve warfare agents, with the byproduct being ozone. Accomplished by forcing the contaminated air through an ozone generator.

Where do you live now, and where would the company be based after YC?

(List as City A, Country A / City B, Country B.)

Lakeview, USA / San Francisco USA

Explain your decision regarding location

Your CEO's recent statement that SF is going to be the new tech hub, and for us to move there.

How far along are you?

Functional devices have been used in hunting over the past several years. Incredibly successful results.
I am stopped at the patent application;
I am stopped at the securing funding for design engineers stage;
I am in the stage of wondering how no one else has thought of this?
Or, if they have, why I cannot find mention online?

How long have each of you been working on this?
How much of that has been full-time? Please explain.

I have been working on this for approximately 12 years?
All parttime.

What tech stack are you using, or planning to use, to build this product?

Unsure whether this is relevant to my startup?
Thus using this space to update the following:
My medical products will employ the same maintenance and repair system as the Apple Store.
As my medical products will be paid for primarily by insurance,
I do not foresee the same issues Apple has recently with, the consumer's right to repair? As, comparatively

speaking
my medical products will have far fewer individual owners
than Apple products.
My medical products will be installed by a
subsidiary and proprietary installation company.
My medical products will be available on a subscription
only basis,
as this will allow us to maintain exclusive legal control of
our products.
Almost all products will be paid for by insurance or the
hospital.
My medical products will be GPS enabled so that we
may,
both track the device for our patient's safety.
And as a means of recovering the devices
should they malfunction or stolen.
My medical products will be connected,
so that we may continuously monitor all products,
for most rapid troubleshooting and return to service
possible.
My medical device emergency replacement plan will
involve next day,
air shipment of a replacement device to keep the number
of techs on call, to a minimum.
As well as to ensure the device properly functions when
received.
My durable medical products maintenance subsidiary will
have sufficient resources
to maintain, at the same day or sooner pace,
any of my medical products installed into their medical
facilities
Our proprietary maintenance company will be the only
entity
licensed to maintain our medical devices.
My intent being to establish, a Steve Jobs-esque regime
of
complete control over all aspects of our product's service
life.

Are people using your product?

Yes

How many active users or customers do you
have? How many are paying? Who is paying you
the most, and how much do they pay you?

Three, including myself.
I had a tester test my device.
My wife has successfully used my device to avoid
detection by whitetail deer while hunting.

Do you have revenue?

No

Anything else you would like us to know regarding
your revenue or growth rate?

No

If you are applying with the same idea as a previous batch, did anything change? If you applied with a different idea, why did you pivot and what did you learn from the last idea?

N/A

If you have already participated or committed to participate in an incubator, "accelerator" or "pre-accelerator" program, please tell us about it.

No

Why did you pick this idea to work on? Do you have domain expertise in this area? How do you know people need what you're making?

I am an avid hunter. For years before the release of the Ozonics hunting device. I spent considerable time and effort attempting to follow mainstream hunting guides for the concealment of my breath odor from game animals. Thus, it was a natural bridge when, after receiving my first Ozonics device, I immediately routed a tube from my breath to the intake of the Ozonics device. That provided me hunting success outside of a blind. However, previously I built an ozone generator with a chimney. While hunting from a ground blind with my chimney-ed ozone filter. My ozone scent filter prevented my detection by all game animals during that hunt. I remained undetected from the game animals as all my human scent was destroyed before it could reach the atmosphere, and from there the game animal's noses, through its journey through the ozone generator.

Who are your competitors? What do you understand about your business that they don't?

None that I can find?
This idea seems unique.

How do or will you make money? How much could you make?

(We realize you can't know precisely, but give your best estimate.)

I will begin making money once I have the patent rights secured and can then solicit funding and cofounders.

How do users find your product? How did you get the users you have now? If you run paid ads, what is your cost of acquisition?

For the biotech side, I need to get a paper published in a top academic journal.

I need to develop some type of advertising campaign the recreational products. Such advertising campaign will include paying influencers to use and positively review the products. Also will have customer service constantly monitoring all socials for negative reviews, so that we make reach out and address the issue before it gets away from that individual. Tactacam Corp. implements this strategy incredibly successfully with their trail cameras, I plan simply to imitate.

Where will most of your initial users be located?

US

Which category best applies to your company?

Biotech

You're being asked the following questions because you are a biotech, healthcare or hard tech company.

Describe the next few stages in developing your product. For each stage, how much time and money will it take?

We need to discuss, and my biz knowledge is only at present being gained.

However, I feel moving quickly to secure the IP protections is key to initial success?

Thus it would take \$3-\$7mil to get at least the medical products, both permanent in hospitals and portable, developed.

A good launch might be to lead off with the outer space colonization effort and coordinated in advance with SpaceX? As they are likely to be our sole, outer space customer.

If you were accepted into YC, what could you accomplish by Demo Day?

If you're applying Early Decision, what could you accomplish by the following Demo Day?

Provide video of my hunting mask effectively concealing me from a whitetail buck, thus allowing me to get the bow shot to harvest the animal.

Does your product need regulatory approval (i.e., FDA)? If so, what is the approval process? What is your plan to get approved, and how much time and money will it take?

My product will need regulatory approval.

I am unsure about the approval process for each item individually, as well as for all? I am sure different

regulatory approval is required for my medical aspects, as well as the space colonization aspects.

Please describe the scientific basis for your product. How does it work?

(It's best if you address your answer to a scientist, but one who is not a specialist in your field)

The electrical field generated by the ozone generator provides a lethal environment the passing through of which, destroys all noxious odors and dangerous organisms. Or at least destroying those capable of being so destroyed? For instance, I do not know whether the nerve agent VX will survive a trip through this example ozone generator: <https://chillxchillers.com/air-purification/uvonair-corona-discharge-cd-inline-duct-ozone-generators?sku=HGC741040>

What experimental data (if any) do you have showing that this would work?

This whitetail buck, 50 yards downwind, in 30mph Kansas winds. Did not detect me when using my portable hunting mask. Even after approaching from a half mile away and directly downwind: <https://drive.google.com/drive/folders/1ltw8DpCrynp4tRMKGQ77p7geYp-8bVd2?usp=sharing>

Have you formed ANY legal entity yet?

This may be in the US, in your home country or in another country.

No

How much money have you raised from investors in total in US Dollars?

Are you currently fundraising?

Yes

Please provide any relevant details about your current fundraise.

Having contacted all my wealthiest friends and relatives, I have unfortunately been unable to secure investment.

If you have not formed the company yet, describe the planned equity ownership breakdown among the founders, employees and any other proposed stockholders. If there are multiple founders, be sure to give the proposed equity ownership of

each founder and founder title (e.g. CEO).

(This question is as much for you as us.)

I expect to complete the launch of this startup, with five or 10 or 15 or 20% of the company. "Entrepreneurship For All (Part I): The UC Berkeley

Startup Guide for students by Silicon Valley Insiders."

(Wordage inside brackets below is from the class,

But should not be read as part of my answer,

as it is provided for background.)

About equity and how it changes over time?

As, I am the principal founder and will own 60% of the company

and I have another co-founder who owns 40%.

As I [the principal founder] came in early and full-time, and came up with the idea,

and so, I will get 60% and my co-founder gets 40%.

That's defined, it's communicated, it's done.

Now, as I start to persuade other people to join,

I will need to carve out equity for them.

So, I will need a stock option pool.

Typically, 20% will go to the option pool,

that's for future employees.

I might get my first round of funding

or first couple of rounds of funding, angel seed funding.

And I give up 20% to investors, my early VCs, right?

And so, now the pie chart looks a little different.

Now I see that I have 20% in the option pool,

20% for investors.

And instead of 60/40, we founders have 36 and 24.

There's almost always a vest, even for the founders,

as well as obviously for the early employees.

Usually, founders will not have a cliff

because they've already proven themselves,

they've already been working at it for years sometimes,

certainly, for months.

[But you can see

how the pie chart starts to change over time.

So, here's an infographic from YC and it's fun.

You'll have this slide separately

in this week's course notes.

So, if you can't quite see all of it, that's fine.

But it's a journey that most startups will go through

where the founder, as you can see at the top there,

has 100% of something that's an idea.

So, it's really not valued much.

It's 100% of nothing.]

Thus, when I get my co-founder

and my hundred percent buy becomes, say, 50/50 or 60/40.

Then I get my early investors and early angel investors, friends and family,

I get my stock option pool for my early employees.

And so, the pie chart changes

and my slice of the pie shrinks.

Then I get my venture capital investors coming in

and my slice, again, diminishes,

but overall value of the pie hopefully keeps growing.

To zero to 10, to 20, to 50 and beyond.

Then I start to get strategics, investment bankers,

and then maybe I go public or have a massive acquisition.
At the end, I expect to have five or 10 or 15 or 20% of the company,
as 17% off a huge pie is infinitely better than 100% of nothing.
[I expect my cofounders to be equal in the sense that they're all giving of their time, full-time.
Or, they may be unequal,
where somebody jumps in first, others come in later.
There may be some who are responsible for the idea, others for the implementation.
I have to look at the relevant experience and expertise of each one of us.
Whatever I decide will depend on these things.
Who's part-time, who's full-time.
Whose idea was it, who's going to be most responsible and most valuable for implementation.
Remember, implementation and execution almost always trumps idea.
So, when we start to think about these and I start to divide up the pie,
whether it's 50/50, or 33 all across,
or somebody gets 50 and the other two get 25.
Whatever I think is equitable and relevant and we agree on, you will communicate that, get to that understanding and get it in writing.
So many startups fail,
because founders, two or three co-founders, are actually on different pages completely a year out on what they expected their equity portion would be.
Now come early in employees, right?
So, I've got my co-founders done and I figured that pie chart out and I've communicated that, and have that in writing.]
What about early employees?
Well, it depends first and foremost on my size and traction as a startup.
[If straight out of the gate, I'm making good money, meaning we have good monthly recurring revenues, if I have great customer traction, you are more valuable; my valuation is high.
So, getting those early employees in, I will have to give less of your equity to them.
It also depends on the role and the value of the employee.
If the employee is my CTO and as I am non-technical, that is a very valuable early employee.
And if that CTO has already been CTO at several big companies or done successful startups, then their value is that much higher for me.
The equity that I give to that early employee should reflect both my value and substance as a startup and their value and substance as an employee.]
Whatever I do,
it'll have to conform to a vesting schedule.
[That means, if I'm giving somebody 10% of my company, it's not given on day one.
These are options that vest typically over four years,

sometimes three, sometimes five.
They have to stay and they have to prove their worth
along the way, to have that vest happen.
Vesting can be monthly or quarterly.
Of that 10%, say, that is designated to them,
they vest a portion of that every quarter over four years.
So, 1/48 every quarter, starting from their start date.
Usually, people have also the concept of a cliff,
where for the first six months or one year we don't vest.
That's kind of a period
where I get to evaluate them
and I get to see
that the person I've given this ownership,
this equity in my company can earn it.]

<https://courses.edx.org/dashboard/programs/b83d59f8-a5ec-41f0-aa6d-06182061edab/>

If you had any other ideas you considered applying with, please list them. One may be something we've been waiting for. Often when we fund people it's to do something they list here and not in the main application.

As I began to get serious about patenting this concept in 2020, I immediately ran into my first issue. Namely, securing funding for a patent. Lack of funding became an issue, as when drafting my patent application in pro per, the IP practice guide recommended including all conceived-of uses in the original application. These additionally conceived-of uses may be patented in future patents. As I was drafting my patent in pro per during the pandemic, a natural additional use that seems necessary to now include is to prevent exhaled viral loads from leaving the patient and entering the atmosphere before being destroyed. My recent conversation about ozone scrubbers, and their related sensors and analyzers with an engineer friend. This has subsequently led to the uses conceived of that include purifying alien atmospheres so that human outer space colonizers will not be required to produce their own breathing air.

Further conceived of uses, begin at simple porta-john exhaust vent ozone filters, with or without incorporating ozone scrubbers. This concept should scale to include filtering all the smell from commercial waste treatment plants. Portable versions can be utilized to prevent viral contagions, such as covid, from escaping the patient to infect others. The idea is to allow the covid or flu sufferer to take the bus to the doctor, even during quarantine, without the risk of infecting their fellow public. The best idea of course, is incorporating them into hospital viral isolation rooms to prevent their virus from exiting their body to infect others or infiltrate the HVAC system. Further additional uses for the original mask concept include non-ozone filtered masks for sport coaches, skiing, winter sports that involve looking through optics, military, and law enforcement uses.
